

The Value of Greenspace:

Tree Planting Strategies for Stormwater Management

Aesthetics:

“Cutting down trees spoils the beauty of the landscape...”

Wildlife habitat:

“There are few birds where there are no trees...”

Flood control:

“We might have dangerous floods if we did not have trees...”

“The leaves of trees catch the rain and hold it...”

“...the moisture that should sink into the soil is carried away in the floods.”

Climate change:

Without forests...”we have severe droughts every year.”

“We should have greater extremes of heat and cold if it were not for the trees and forests. “

The future of urban forestry “will rely less upon new knowledge of how to care for trees than it will upon new knowledge of **how trees help to care for people.**”

- Fred Bartenstein, 1981

About the Model

Breakdown of your tree's benefits

Click on one of the tabs above for more detail

This **24 inch Northern red oak** provides overall benefits of: **\$162** every year.

While some functional benefits of trees are well documented, others are difficult to quantify (e.g., human social and communal health). Trees' specific geography, climate, and interactions with humans and infrastructure is highly variable and makes precise calculations that much more difficult. Given these complexities, the results presented here should be considered initial approximations—a general accounting of the benefits produced by urban street-side plantings.

Benefits of trees do not account for the costs associated with trees' long-term care and maintenance.

If this tree is cared for and grows to 29 inches, it will provide **\$170** in annual benefits.

i-Tree Canopy Annual Tree Benefit Estimates based on these values in lbs/acre/yr and \$/T/yr: CO 0.500 @ \$1,333.50 | NO2 4.766 @ \$491.34 | O3 31.460 @ \$2,292.12 | PM2.5 1.468 @ \$84,658.02 | SO2 0.558 @ \$96.84 | PM10 16.112 @ \$6,268.44 | CO2seq 7,486.286 @ \$19.43 | CO2stor is a total biomass amount of 251,395.359 @ \$19.43*

Note: Standard errors of removal amounts and benefits were calculated based on standard errors of sampled and classified points.

About i-Tree Canopy

The concept and prototype of this program were developed by David J. Nowak, Jeffery T. Walton and Eric J. Greenfield (USDA Forest Service). The current version of this program was developed and adapted to i-Tree by David Ellingsworth, Mike Binkley, and Scott Maco (The Davey Tree Expert Company).

Limitations of i-Tree Canopy

The accuracy of the analysis depends upon the ability of the user to correctly classify each point into its correct class. As the number of points increase, the precision of the estimate will increase as the standard error of the estimate will decrease. If too few points are classified, the standard error will be too high to have any real certainty of the estimate.

Lowest Flow Date	09/28/05		09/28/05		01/01/05	
Median Flow (cubic meters / hour)	340.2		338.2		0.0	
Number of flow events ABOVE median flow	37.0		10.0		17.0	
Average length of flow events with flow ABOVE median (hours)	117.1		464.6		170.6	
High Flow: Number of flow events ABOVE 1 standard deviation	27.0		1.0		11.0	
Average length of flow events ABOVE 1 standard deviation (hours)	155.1		655.0		201.7	
Number of flow events BELOW median flow	36.0		9.0		0.0	
Average length of events BELOW median (hours)	121.3		484.9		0.0	

Step 3) i-Tree Hydro Hydrological Parameters

These parameters define study area soil, vegetation, and water conditions. *Project Location: Holland, Michigan*
The goal is to adjust them until modeled streamflow resembles observed streamflow.
You may create and compare multiple parameter sets. Start by Auto-Calibrating with the Suggested Default Values, and then Compare the Parameter Set Calibration Results. You modify these parameter sets by FIRST Retaining and Editing a NEW Parameter Set. At any time, run the Auto-Calibration routine with any Current Parameter set to create new Auto-Calibrated Parameters which may then be further adjusted.

Note: Auto-calibration is available only when modeling a watershed.

Current parameter set: Suggested Default Values

Retain and Edit as NEW parameter set

Delete this parameter set

Auto-Calibrate this Parameter Set

Compare Parameter Set Calibration Results

Parameters:

We start with a preliminary value for the amount of water coming through the gauge.

Annual Average Flow at Gauging Station (cms) 0.7612444444

Then we select a soil type to account for the way water moves into and through the ground.

Soil Type Sandy Clay Loam

Wetting Front Suction (m) 0.12

Wetted Moisture Content (m) 0.48

Surface Hydraulic Conductivity (cm/h) 0.2700

Condition of the soil in terms of root penetration and water content is set next.

Depth of Root Zone (m) 0.05

Initial Soil Saturation Condition (%) 50

Advanced Settings

Leaf Transition Period (days)	28
Leaf On Day (Day of year 1-365)	127
Leaf Off Day (Day of year 1-365)	280
Tree Bark Area Index	1.7
Shrub Bark Area Index	0.5
Leaf Storage (mm)	0.2
Pervious Depression Storage (mm)	1.0
Impervious Depression Storage (mm)	2.5
Scale Parameter of Power Function	2
Scale Parameter of Soil Transmissivity	0.023
Transmissivity at Saturation (m ² /h)	0.13
Unsaturated Zone Time Delay (h)	10
Time Constant for Surface Flow: Alpha (h)	1.0
Time Constant for Surface Flow: Beta (h)	2.0
Watershed area where rainfall rate can exceed infiltration rate (%)	65.0

Next: Step 4) i-Tree Hydro Alternative Ca

Sewer overflows during storm hit 10 billion gallons

By Eric D. Lawrence, Detroit Free Press 9:50 a.m. EDT October 26, 2014

(Photo: Jessica J. Trevino Detroit Free Press)

f 356 CONNECT **t 112** TWEET **in 12** LINKEDIN **28** COMMENT EMAIL MORE

Almost 10 billion gallons of sewer overflows poured into southeast Michigan's waters in the historic August flooding, according to a Free Press review of data from the Michigan Department of Environmental Quality.

That number includes more than 44 million gallons of raw sewage from sanitary sewers and almost 3 billion gallons from combined sewer and storm water systems, all untreated, raising concerns about deteriorating water quality in the Great Lakes system.

A full accounting of the total was not available immediately, but the Macomb County Health Department had posted information after the storm indicating 1 billion gallons of overflows had poured into Lake St. Clair or its tributaries, according to an earlier Free Press report. The volume affecting the whole region was 10 times that total, and the number now reported by Macomb County is more than twice the initial estimate.

SEWER OVERFLOWS A CONTINUING PROBLEM

Southeastern Michigan saw 10 billion gallons of sewer overflows during the massive storm on Aug. 11. Much of that flow ended up in Lake St. Clair, but overflows are not limited to one storm and the lake is a regular recipient of overflows. Between Jan. 1 and Sept. 17, at least 3.6 billion gallons of overflows were recorded in waters leading to the lake. The Macomb County Health Department compiles reports of overflows from retention treatment basins, combined sewers and sanitary sewers that flow into the lake or its tributaries, not including upstream in St. Clair County. The volumes so far this year are the highest since 2011.

Sewage overflows into Grand River a thing of the past for Grand Rapids

The last time Grand Rapids had a combined-sewer overflow was during April 2013 flooding, when 436 million gallons of wastewater flowed into the Grand River. (MLive.com File)

GRAND RAPIDS, Mich. (WOOD) — Restore the rapids, open up the banks to the public and clean up the water: That's the general plan for the Grand River in Grand

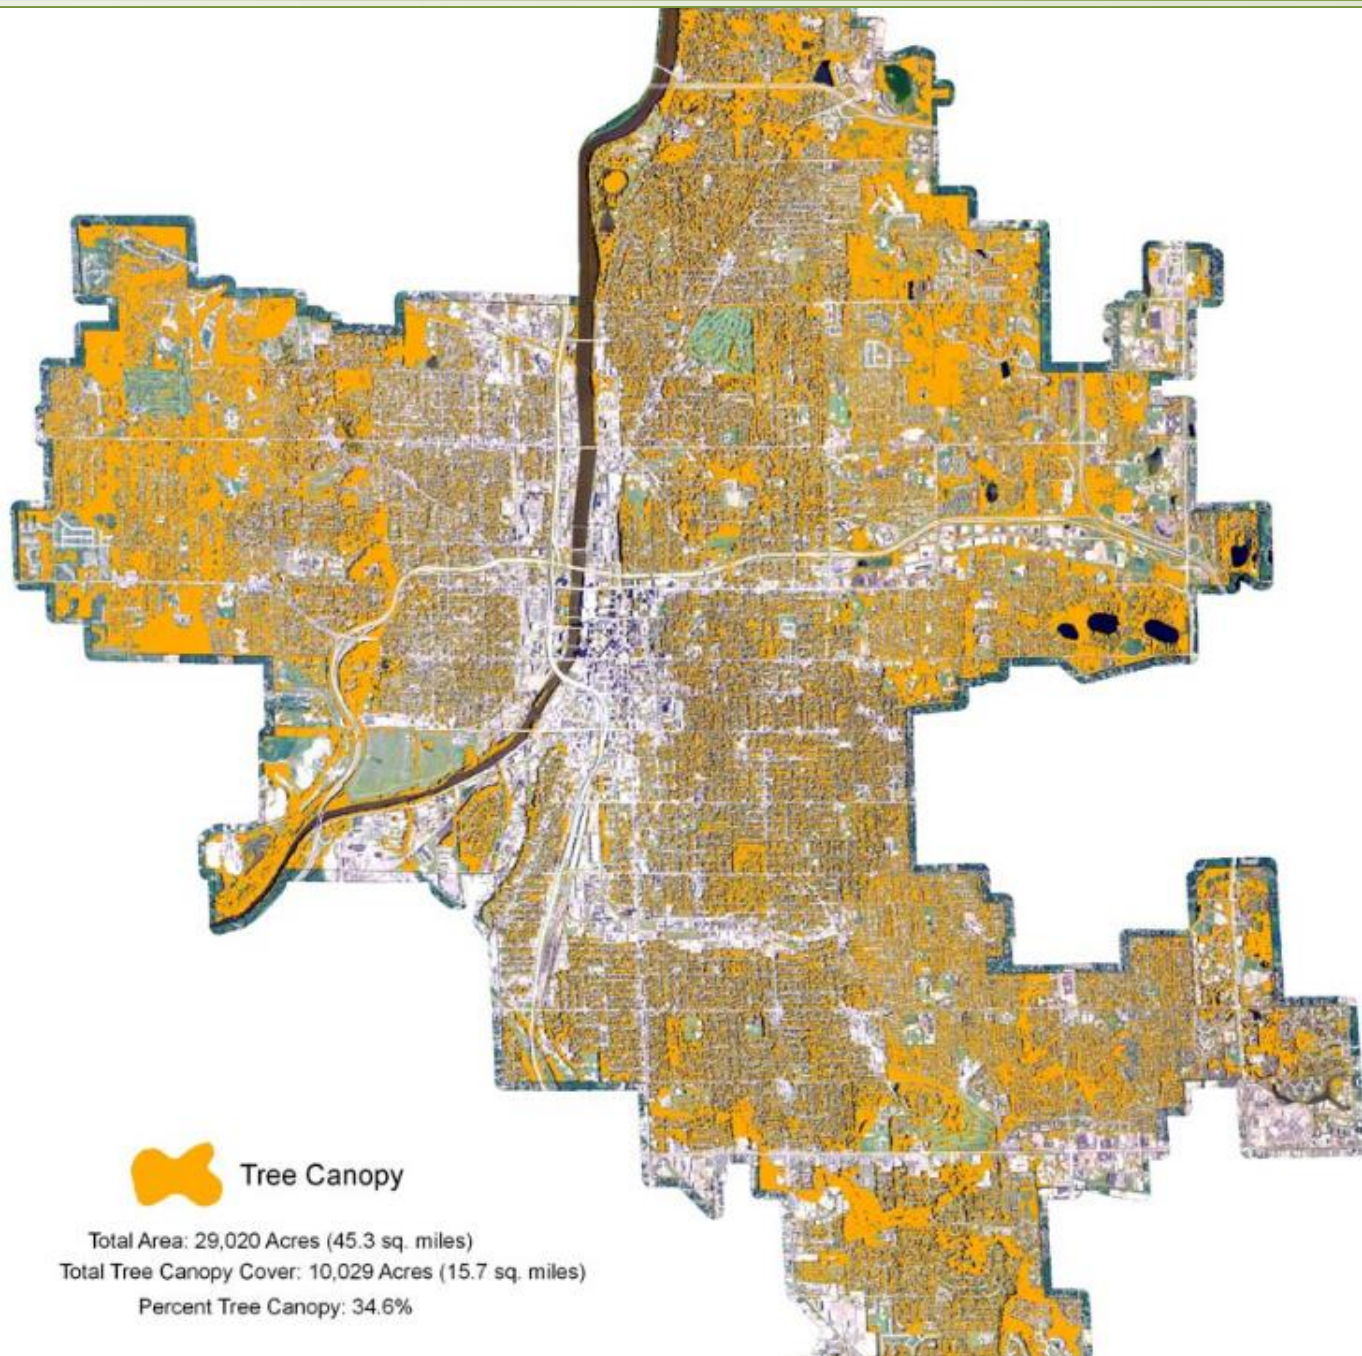

Table 3.

Runoff	
2-year, 24-hour Rainfall event:	2.37 inches
Curve Number of existing conditions:	78
Curve Number if the trees were replace with new impervious surfaces:	89
Additional Stormwater storage volume needed if the trees were replaced with impervious surfaces:	67,075,658 ft ³
Construction cost per ft ³ *	\$5.50
Total Stormwater Savings:	\$368,916,122
Annual costs based on payments over 20 years at 6% interest	\$32,163,789 per year
* Construction costs based on the cost to build an ADS Storm Tech underground pipe detention system to handle the additional stormwater.	

TOTAL VALUE OF SERVICES: \$368,916,122

Adopt a goal of 40% urban forest canopy

- Incorporate 40% urban forest canopy goal in Green Grand Rapids
- Identify canopy goals for specific land uses

Develop a data base on the city's urban forest to develop prioritized planting and management plans

- Short term: Develop a sample-based inventory profiling several areas of the city and identify maintenance and planting priorities for each
- Long term: Develop a complete inventory of the city's public trees as the basis for citywide maintenance and planting plans

Enact public policy changes to maximize tree preservation and planting incentives

- Update the tree ordinance, planning and zoning policies and other tree-related City policies based on a review of existing ordinances and policies and promising practices from other communities

Provide adequate personnel and budget resources to ensure effective, proactive functioning of the Forestry Division

- Devote 100% of the forestry supervisor position to forestry-related duties
- Develop an urban forest management plan
- Provide adequate funding to implement the management plan, including resources to support outside fund development and community/volunteer involvement

Increase public awareness and involvement as the foundation for developing broad public support for urban forest issues

- Create opportunities for public education and volunteer involvement, including tree tours, workshops, planting and maintenance projects
- Create opportunities for public and private sector financial support

about the brewers grove

The Brewers Grove project started in 2013 when local brewers asked Friends of GR Parks (FGRP) how they could celebrate being named Beer City USA by give back to our parks and public spaces. And the idea was seeded to create tree-themed beers that would be offered for a limited time with proceeds going directly to FGRP's Urban Forest Project and tree
